

1. Open the **app.js** file. Create a new module named **MailboxApp**. Attach it to the `<body>` element in **index.html** file.
2. Open the **emails.json** file. It is a JSON object containing an array of emails. You will fetch this data and display it in the app.
3. In the **js** directory, make a new folder named **services**. In this folder, create a new file named **emails.js**
4. Create a new service named **emails**. Use `$http` to get the email data from **emails.json**
5. Include the **emails.js** script in the **index.html** file.
6. Open the **HomeController.js** file. In the controller, use the **emails** service to fetch the data from the json file. Add emails into the **HomeController** as a dependency. Use **emails** to fetch the email data and store it into a property called **\$scope.emails**
7. Attach the controller to the `<div>` element with the class of `"main"`.

8. In **index.html**, find the `<div>` element with the class of *email*. Looking at the format of the data in **emails.json**, display each email's *from*, *subject*, and *datetime* in their corresponding `` elements.
